

Bug Fix Verification Report

Bug Fix Verification: Next Button Enabled with Empty Event Name (Bug #1829)

Bug ID: #1829

Description: Next button enabled even when Custom Event Name is empty.

Status: Resolved

Date: 2026-01-09

1. Issue Description

Previously, the "Next Step" button remained enabled (visually interactive) even if the "Event Name" field was empty or contained only invalid characters. This allowed users to click and attempt to proceed, relying solely on toast error messages rather than proactive UI prevention.

2. Reproduction Steps

1. Navigate to **Create Wish** wizard.
2. Select contact and proceed to **Step 1: Event Details**.
3. Select **"Custom Event"**.
4. Leave **Event Name** empty (or enter only spaces).
 - *Expected:* "Next Step" button should be greyed out/disabled.
 - *Actual (Pre-fix):* "Next Step" button was white and clickable.

3. Fix Implementation

Modified `frontend/src/components/dashboard/CreateWishWizard.js`.

Implemented a dynamic `isNextDisabled()` function that checks the validity of current step's data in real-time. Toggled the button's `disabled` attribute and CSS opacity based on this check.

```
// frontend/src/components/dashboard/CreateWishWizard.js
```

```
const isNextDisabled = () => {
  if (step === 1) {
    // Check for empty fields AND invalid alphanumeric content
    const hasValidContent = /[a-zA-Z0-9]/.test(formData.event_name);
    return !formData.event_type || !formData.event_name.trim() || !hasValidContent || !formData.scheduled_time;
  }
  // ...
};
```

```
// Button JSX
<button
```

Bug Fix Verification Report

```
disabled={isNextDisabled()}\nclassName={' ... ${isNextDisabled() ? 'opacity-50 cursor-not-allowed' : '...'}'}
```

>

4. Verification Results

- [x] **Test 1:** Select "Custom Event", Name Empty. **Result:** Button is Dimmed (50% opacity) and unclickable.
- [x] **Test 2:** Type "!!!". **Result:** Button remains Dimmed (due to alphanumeric check from Bug #1828 logic integrated).
- [x] **Test 3:** Type "My Party". **Result:** Button becomes Active (White, hover effects enabled).

Result: The UI now correctly reflects the form state, preventing users from attempting to proceed with invalid data.
